## DESCRIPTION

Lithosys is an interactive installation consisting of :

- A website (chat Room)
- A sculpture made of a stand with a stone held levitating by an electromagnetic field. The stand is roughly 1m30 high, 50cm wide, 50cm deep.

Users connect to the website ([www.lithosys.herokuapp.com](http://www.lithosys.herokuapp.com)), allowing them to chat with an artificial intelligence.

Each message sent by a « human » user is also received by a computer in the stand, that translates this message in a variation of the magnetic field used to levitate the stone, and a voice synthesis.

## **TECHNICAL NEEDS**

### **POWER SUPPLY**

The stand needs a power supply, with 3 sockets. Ideally, the electrical cable will be hidden under a technical flooring. If impossible, we will need one single power cable and the multiple plug will be integrated in the stand.

### **NETWORK**

The computer in the stand needs a good quality wired internet connection.

### **SOUND**

A small sized amplified speaker (PC speaker for example, as small as possible) must be supplied , as well as the « mini jack » cable that will be connected to the computer in the stand. It will also be placed in the stand.

### **LIGHT**

Light must be placed according to the space.

### **iPad**

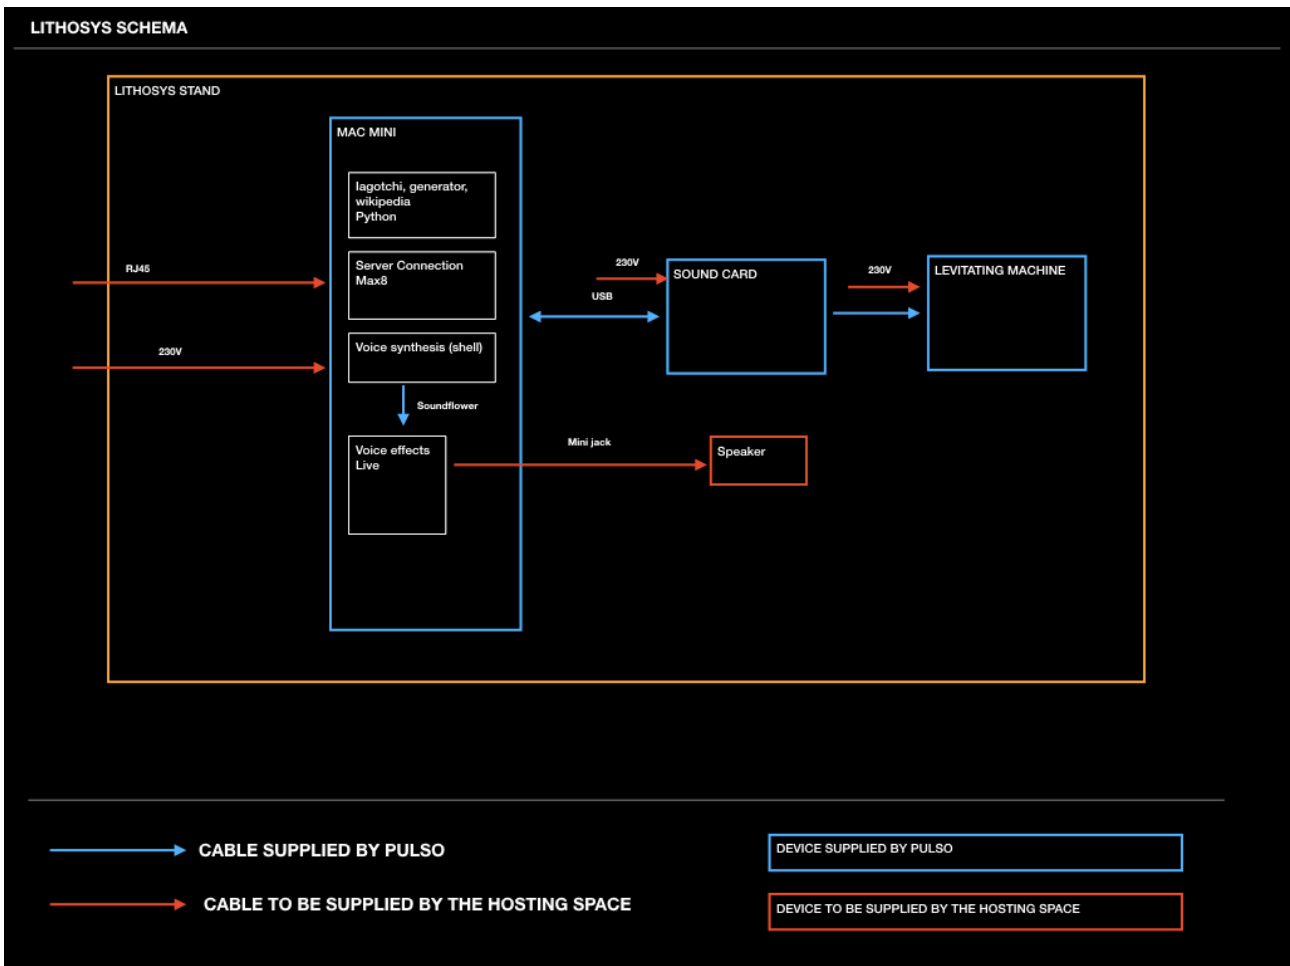

An iPad (or equivalent) must be supplied , connected to the internet, to allow users not equipped with smartphones to use the piece.

### **Ipad stand.**

A discreet stand with power supply for charging must be supplied.
